Task 1)

Make a website for buying music equipment. Grouping should be enabled in the following way:

- Players: the part where the data for CD players is displayed

- Mixers: the section where the data about the music mixers is displayed

- Shopping cart: the part where only the shopping cart is displayed *

* The shopping cart is visible across all sections of the page

By selecting any part, the data about it are visible in the same view. The available products are divided in two categories: Players and Mixers. The two categories are separate lists (sortable). Shopping Cart is a third list that is connected to the previous two lists.

Purchase is done in such a way that the product the user wants to buy is dragged from his original list in the cart. The cart originally contains one member - "Fill me up!" For which any interaction is disabled.
